Preface

This short book demonstrates Quarto's **book** project type: multiple chapters, automatic numbering, cross-chapter references, a shared bibliography, and output to both a navigable website and a single typeset PDF.

Render it with `quarto render book`.

1 Introduction

Haematology spans red cells, white cells, platelets and coagulation. This book uses **anaemia** (Chapter [2](#)) as a worked chapter to show cross-references, figures and citations working across a multi-file project.

2 Anaemia

Anaemia is classified by mean cell volume (MCV) into microcytic, normocytic and macrocytic categories.

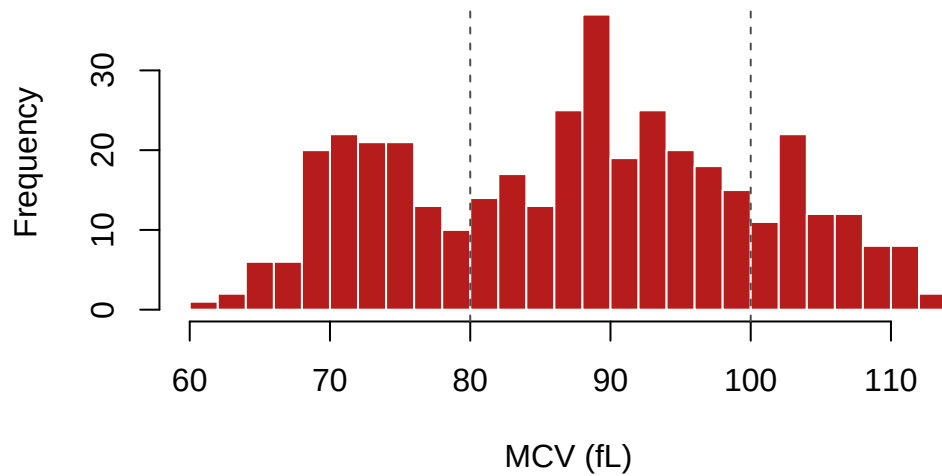

Figure 2.1: Illustrative distribution of MCV in a mixed clinic population.

Figure 2.1 shows the three classes separated at 80 and 100 fL. Management of iron-deficiency anaemia and the wider evidence base are reviewed elsewhere (Example and Sample 2025).
